

Dental Laboratory Concepts

Our experienced technicians design the coping or framework to precisely fit the model or die.

A CLEAR CHOICE

We know that laboratory customers have a choice, but you can always count on DLC to ease your burden when you can deliver the latest products to your customers. Receive exceptional quality zirconia products and command value-added pricing, with FDA-approved materials representing major dental manufacturers, one-way domestic shipping charges, and reliable turn-around times. Most importantly, you can now outsource with peace of mind!

DLC opens new milling center

DLC's domestic win-win solution

Have you thought about expanding your zirconia lab business, but don't have the resources to accommodate today's new technology and meet the high demands? Dental Laboratory Concepts provides yet another win-win solution to help dental laboratories increase their marketshare without compromising their current business efforts.

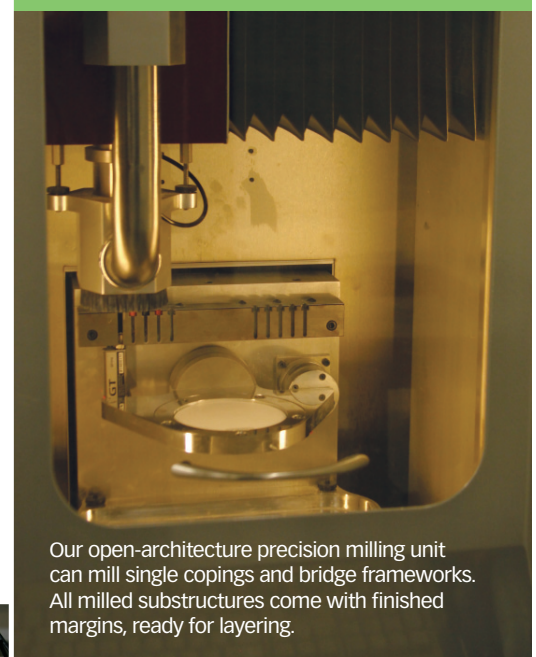

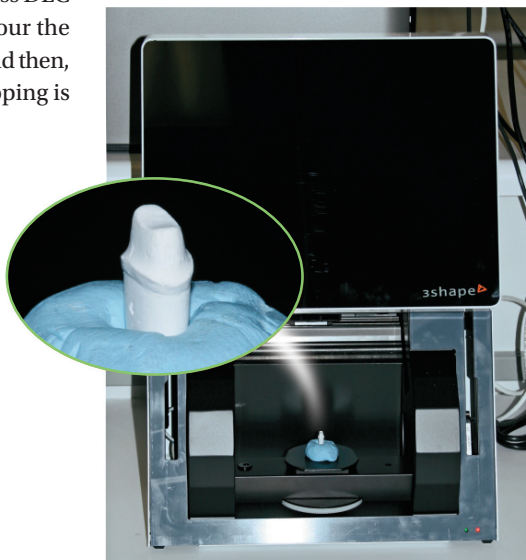

DLC has opened a new milling center to work as an extension to dental laboratories nationwide, delivering the best in quality and strength with its competitively priced zirconia copings.

Dental Laboratory Concepts now delivers to its customers a zirconia coping with a flexural strength (1200 MPa) that is comparable to leading brands such as Lava and Procera. By outsourcing to DLC, customers will not only benefit from the extraordinary fit and strength of DLC Zirconia, but from the resulting increase in their bottom-line.

DLC makes it easy for labs to receive their zirconia copings in just four business days! Since a scanner is not required, laboratories merely send us an impression or a model, and DLC does the rest! Delivering a precision-milled coping guaranteed to fit is an easy process DLC is pleased to do for its laboratory customers. First, we pour the model or scan the model or the die, then design the case, and then, precision-mill the framework to guarantee the fit. The coping is delivered with a finished margin!

Precision scanning and milling are key to a well-fitting framework.

Our open-architecture precision milling unit can mill single copings and bridge frameworks. All milled substructures come with finished margins, ready for layering.
